Priority Action Items

1. **CRITICAL** Category Match

? CRITICAL CATEGORY MISMATCH: Your GBP primary category is 'Laundry', but the expected category for this franchise is 'Carpet Cleaning Service'. This is a major red flag ? an incorrect primary category means Google is showing your listing for the WRONG types of searches. For example, people searching for 'carpet cleaning service' services will not find you in the Map Pack. Log in to your GBP dashboard immediately and change the primary category to 'Carpet Cleaning Service'. You may keep the current category as a secondary category if relevant.

2. **HIGH** City Page

? LOCAL TARGETING OPPORTUNITY: No dedicated local city page was found (such as /grand-forks). Creating a dedicated service page for your primary city is a highly effective strategy to capture high-intent local search traffic. Develop a high-quality local page featuring localized service text, customer reviews from the area, a local phone number, and a map embed to capture regional customers.

3. **HIGH** Performance (Mobile)

Your Mobile performance score is 52/100. While your site is functional, it has noticeable latency that could cause visitors to bounce before the page fully loads. We strongly recommend implementing the following optimizations to achieve an excellent score: (1) Defer non-essential scripts (like tracking codes or chatbots) so they only load after the main content; (2) Set explicit width and height attributes on all images and containers to prevent layout shifts; (3) Utilize modern lazy-loading for all below-the-fold images to save initial bandwidth.

4. **HIGH** LCP (Largest Contentful Paint)

Your Largest Contentful Paint (LCP) is 10.52 seconds, which exceeds the recommended threshold of 2.5s. LCP measures when the main, largest piece of content on your screen (usually a hero banner, large heading, or primary image) becomes visible. A slow LCP makes the page feel laggy and unresponsive to users. To speed up LCP: (1) Preload your primary hero image or main banner image in the HTML header (using <link rel='preload'>) so it starts downloading immediately; (2) Eliminate or defer render-blocking JavaScript and CSS files that delay page construction; (3) Optimize server response times and database queries so the server sends the HTML document faster; (4) Ensure your web server has Gzip or Brotli compression enabled and utilizes modern image formats like WebP.

5. **MEDIUM** Title Length

?? TITLE TRUNCATION WARNING: The title exceeds the recommended limit of 60 characters. Search engines will truncate excessive title lengths with an ellipsis ("...") in search results, creating a messy appearance and reducing CTR. Refactor the title to be under 60 characters by placing your primary high-priority keyword and city name at the front, and branding at the end.

6. **MEDIUM** Meta Description CTA

? CALL-TO-ACTION RECOMMENDATION: Your meta description lacks a strong call-to-action (CTA) keyword. A persuasive CTA keyword (such as "Call today", "Schedule a free quote", or "Book online") bridges the gap between searching and booking. Revise the description to include an active, enticing prompt that instructs the

user on their next step.

7. **MEDIUM** Heading Hierarchy

?? OUT-OF-ORDER HEADING WARNING: A subheading (such as H2 or H3) appears physically in the code before the primary H1 topic heading. HTML heading hierarchy should always flow sequentially, starting with a single H1 as the page title, followed by H2 and H3 tags to organize sections. Placing subheadings before the main topic title disrupts the structural outline of your site, reducing search crawler understanding and screen reader usability. Demote or re-order these preceding subheadings in your theme/code so that the H1 is the first heading in the HTML source.

8. **MEDIUM** Canonical Tag

? DUPLICATE CONTENT MITIGATION: No canonical link tag was found. Canonical tags tell search engines which version of a URL is the master copy, preventing indexing issues caused by duplicate URL structures (such as http vs https, or www vs non-www). Add a `<link rel="canonical" href="https://[your-domain]/">` to the HTML `<head>` to consolidate all link equity.

9. **MEDIUM** Performance (Desktop)

Your Desktop performance score is currently 49/100, which is critically low and severely harms your search engine rankings and conversion rates. Search engines like Google penalize slow-loading sites, especially on mobile devices where network speeds are slower. To resolve this, you must prioritize optimizing your site's assets: (1) Optimize and compress all images using next-gen formats like WebP or AVIF; (2) Defer or minify unused JavaScript and CSS files that block the browser from rendering the page quickly; (3) Leverage browser caching and utilize a Content Delivery Network (CDN) to serve assets faster.

10. **MEDIUM** CLS (Cumulative Layout Shift)

Your Cumulative Layout Shift (CLS) score is 0.184, which is higher than Google's good threshold of 0.1. CLS measures visual stability. A high CLS means elements (like text, images, or buttons) are jumping around on the page while it loads, which frustrates visitors who might accidentally click the wrong link or button. To fix CLS: (1) Ensure every image, video, and iframe has explicit width and height dimensions defined in the HTML/CSS so the browser reserves the correct space beforehand; (2) Never inject dynamic content (like promo banners, alerts, or newsletter signups) above existing content after the page has started rendering; (3) Use CSS aspect-ratio properties and reserve slots for slow-loading third-party widgets like Google Maps or embedded reviews.
